Update on Emergency Care Dataset for AEC

Emergency Care Data Set

- The Emergency Care Data Set (ECDS) project aims to develop and implement a new minimum data set for emergency care which can properly capture and represent the full extent and granularity of Emergency Department (ED) activity in England.
- Why?
 - Gaps in data.
 - Existing data set had not kept pace with current practice.

Stakeholders

The ECDS project is a collaborative project between:

- The Royal College of Emergency Medicine
- The Department of Health
- NHS England
- NHS Digital
- NHS Improvement
- NHS Providers and Public Health England
- AEC Network representation on National steering group

Connected Information

The project has also been identifying overlapping areas of work which need to be considered in the development of the ECDS including:

- Information Sharing for Tackling Violence (ISTV)
- Trauma Audit and Research Network (TARN)
- Also the guidelines developed by the PRSB and Academy of Medical Royal Colleges (AoMRC) for the clinical structure and content of patient records

- We have been working with the ECDS team and National Steering group to understand how the ECDS might support the collection of Ambulatory Emergency Care and shape the development to ensure functionality.
- Increased interest at national level in maximising AEC delivery has been a lever for progressing the application of ECDS to this patient cohort.

| While ECDS has been developed to ensure the needs of ED's, Urgent Care Centres and Am Imregency Care will be met, we have been asked to include codes of other divisoil settings defined Administers Units, Arributume Service ACP divisal assessment that may word to us and therefore have included these in the code set for compatibility. | such as |

Justification Emergency care is delivered in many different settings, and the value-added by these different modes of healthcare in different environments is very poorly understood.

This data describes the type of site providing the care so that commissioners can understand the casemix, acuity and value-added, which in turn enables accurate provision of resources to match patient need.

The coding system is primarily designed for ED and Ambulatory Emergency Care use. The additional codes for other modes of urgent care delivery allow commissioners to use a common system for these if wanted.

ECDS Pilots

- Development of the ECDS by providing data field verification, code set content validation and how the data fields are collected in practice in type 1 EDs.
- End-to-end test to enable the collection, extraction, processing and analysis of data.
- Extend tests to type 3/4 EDs.
- Formal impact assessment.
- Sign off and implementation in EDs
- Testing and Impact assessment in AEC.
